## Git commands

### # Configuring user information used across all local repositories

- 1) `git config --global user.name "firstname"`  
→ sets a name that is identifiable for credit when review version history.
- 2) `git config --global user.email "[valid-email]"`  
→ sets email address that will be associated with each history marker.
- 3) `git config --global color.ui auto`  
→ sets automatic command line coloring for git for easy reviewing.

### # Setup & initialize

- 1) `git init`  
initialize an existing directory as a git repository.
- 2) `git clone [url]`  
retrieve an entire repository from a hosted location via url.

### # Working with snapshots & git staging area.

- 1) `git status`  
• show modified files in working directory, staged for your next commit.

2) `git add :`  
• add the files as it looks now to your next commit.

3) `git commit -m ["Message"]`  
• commit your staged content as a new commit snapshot.

## # Branch & Merge

1) `git branch`  
• list your branches. a \* will appear next to the currently active branch.

2) `git branch [branch-name]`  
• create a new branch at the current commit

3) `git checkout`  
• switch to another branch.

4) `git merge`  
• merge the specified branch's history into the current one.

5) `git log`  
• shows all commits in the current branch's history.

6) `git log -1`  
• shows the first commit.

7) `git show [SHA]`  
• show any object in git in human readable form.

8) `git push [alias] [branch]`  
• transmit local branch commits to the remote repository branch.

9) `git pull`  
• fetch & merge any commits from the tracking remote branch.

10) `git rm [file]`  
• deletes the file from the project & stage the removal for commit.

11) `git log --oneline`  
• condense each commit to a single line.

# Git Ignoring  
We need to track only source code files & configuration files & not the environment files as they will be different for different person.

To remove files from git but to still keep them on local machine, we use

• `git rm --cached .classpath`  
cached :- to keep file in work directory but remove from git staging area.

• `git rm -r --cached bin/`  
All files i.e. `cached` & `bin` are removed from staging area.

=> To avoid untracked files to be committed again, we create ignore file & add the files there.

- 1) touch .gitignore // creates file
- 2) nano .gitignore // nano is text editor  
in nano file write  
\* .class  
bin /  
\* classpath

Now save above file.

- 3) git status
- 4) git add
- 5) git commit -m "Added .gitignore & removed bin / from staging".

## # Commit history

- 1) git log  
prints commit history of current branch  
(most recent ones show up)
- 2) git log - 2  
shows first 2 commits (recent ones)
- 3) git log --pretty = online  
shows hash value & a message in single line.

## # Amend last commit

- 1) git commit --amend  
amends the commit message. (last commit message).

# To change the editor  
git config --global core.editor "vi"  
Set editor as "vi" editor.

# Git hosting & remote repository

git repositories

1) Github

2) Atlassian bitbucket (integrated with jira, confluence)

3) gitlab

a) git remote -v

-> to check that git repository is not connected with any other local repository yet.

b) git remote add origin [git URL]

c) git push origin -u master  
-u = upstream (linking our repo to central repo).

README.md file - people use this file to put their repository description.

# Git stash :-

When to use stash

- Temporarily put work aside
- Apply the same changes on multiple branches
- Create a new branch based on current changes later

- a) `git stash`  
saved working directory
- b) `git stash apply`  
⇒ to apply changes made in file.
- c) `git stash list`  
⇒ list of stash changes.

#

### Git Reflog

At times, we can accidentally lose a commit.

Git won't be able to restore the files that were never in the staging area.

`git reflog` ÷ `reflog` silently records the head pointer & how does it look like, everytime we commit changes, `reflog` is updated.

- `git log -g`
- `git reflog --since="1 hour"`  
↳ shows last 1 hour commit y

# ***Certificate of Completion***

***This is to certify that **Simran Sarhaddi**  
successfully completed 3.5 total hours of **Git from  
Basics to Advanced: Practical Guide for  
Developers** online course on April 23, 2021***
